# HCI inspired by

## HUMAN-COMPUTER INTERACTION

third edition

**Alan Dix - Janet Finlay - Gregory Abowd - Russell Beale**

Prentice Hall, 2004. ISBN 0-13-046109-1

# The Human Processor

Humans can be viewed as an information processing system:

- information received and responses given via input-output channels
- information stored in memory
- information processed and applied in various ways

Capabilities of humans in these areas are important to design, as are individual differences

Stuart K. Card, Allen Newell, and Thomas P. Moran.  
1983. The Psychology of Human-Computer  
Interaction. L. Erlbaum Assoc. Inc., Hillsdale, NJ,  
USA.

# Take Home Message

You are not the user, introspection will not work

You are not the user, introspection will not work

You are not the user, introspection will not work

You are not the user, introspection will not work

You are not the user, introspection will not work

You are not the user, introspection will not work

You are not the user, introspection will not work

# Humans input-output processing

A **cortical homunculus** is a distorted representation of the human body, based on a neurological "map" of the areas and proportions of the human brain dedicated to processing motor functions, or sensory functions, for different parts of the body.

[[https://en.wikipedia.org/wiki/Cortical\\_homunculus](https://en.wikipedia.org/wiki/Cortical_homunculus)]

# Vision

Two stages in vision :

- physical reception of stimulus
- processing and interpretation of stimulus

The Eye:

- mechanism for receiving light and transforming it into electrical energy
- light reflects from objects; their images are focused upside-down on retina
- retina contains rods for low light vision and cones for colour vision
- ganglion cells detect pattern and movement

## HUMAN EYE ANATOMY

# Vision: important issues

The vision system is very powerful but suffers from many problems and limitations:

- Some features can be perceived very quickly and accurately
  - Preattentive perception
- But limited in resolution, perception of color, lightness, movement
- The brain tries to compensate but cannot always
  - Blind spot experiment
- Deficiencies
  - Color blindness
    - 8% of males and 0.5% of females
  - Change blindness

# Physical World → Visual System

*Simple Anatomy of the Retina, Helga Kolb*

## Rods

No color (sort of)  
All over the retina  
More sensitive

## Cones

**Three** different kinds of  
“color receptors”  
Mostly in the center  
Less Sensitive

# Perception of color is split in 3

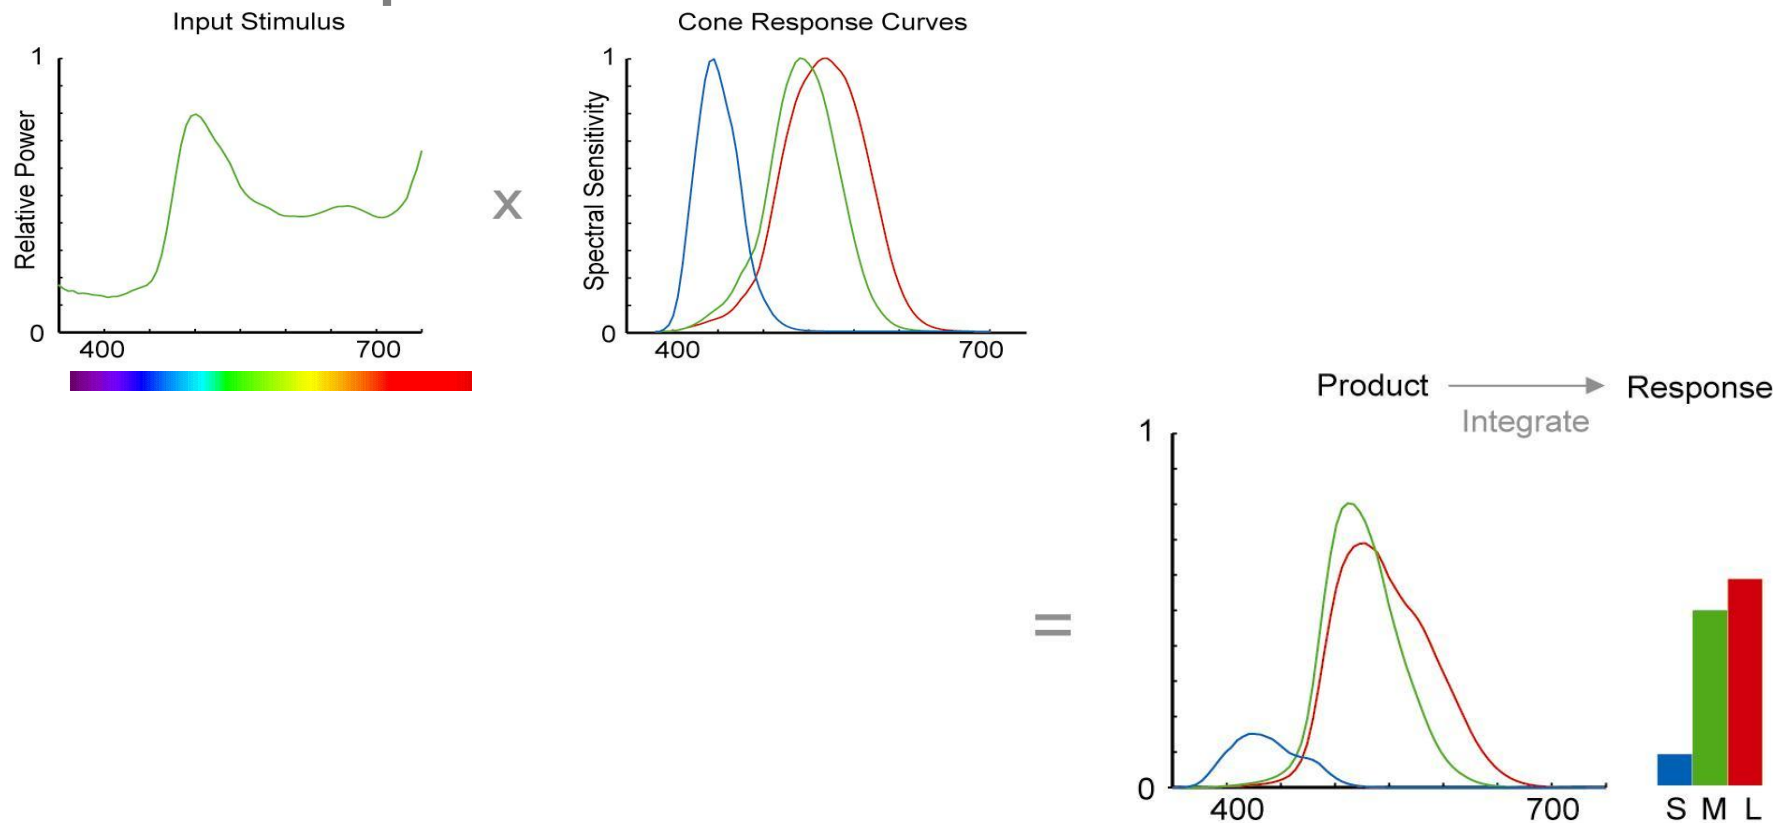

- Old visual system: intensity
- Newer visual system: hue/saturation

# Cone response

- LMS (Long, Middle, Short) cones
- Capture different wavelengths (some better than others)
- Transmit a signal to the brain

# Cone response

Cumulated intensities detected

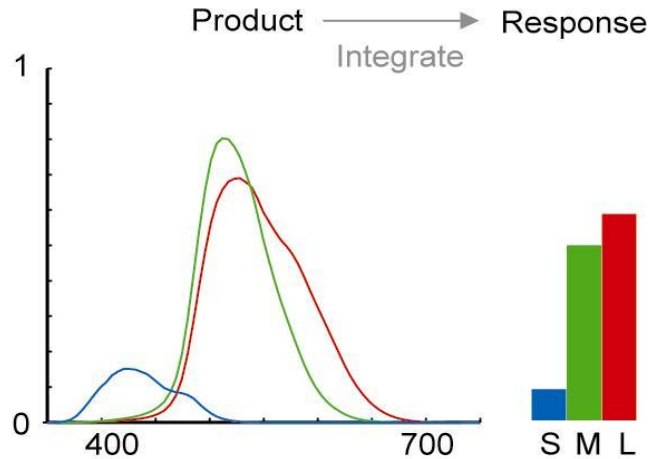

S 

M 

L 

SML decomposition

# Visual System → Color Models

This is the color the eye sees

This is not necessarily the color the brain sees!

**PREATTENTIVE PROCESSING**

# How many 3's do you see?

1281768756138976546984506985604982826762  
9809858458224509856458945098450980943585

8845789809821677654876364908560912949686

# How about now?

12817687561**3**8976546984506985604982826762  
980985845822450985645894509845098094**3**585  
90910**3**0209905959595772564675050678904567  
8845789809821677654876**3**64908560912949686

# Preattentive Processing

- Some stimuli can be perceived **without** the need for focused attention
- Generally within **200-250 ms**
- Seems to be done **in parallel** by the low-level vision system

Visual encoding has a **big** impact on this!

Visual encodings influence **preattentive** processing

**DETERMINE IF A RED CIRCLE  
IS PRESENT**

**Q1. Y a-t-il un cercle rouge?**

**Q2. Y a-t-il un cercle rouge?**

**Q3. Y a-t-il un cercle rouge?**

**Q4. Y a-t-il un cercle rouge?**

**Q5. Y a-t-il un cercle rouge?**

**Q6. Y a-t-il un cercle rouge?**

# Q1. Y avait il un cercle rouge?

**Non**

## Q2. Y avait il un cercle rouge?

Oui

# Q3. Y avait il un cercle rouge?

Oui

# Q4. Y avait il un cercle rouge?

**Non**

# Q5. Y avait il un cercle rouge?

Oui

# Q6. Y avait il un cercle rouge?

**Non**

# Hue

Yes, can be done preattentively

# Shape

Yes, can be done preattentively

# Hue and Shape

Cannot be done preattentively due to the  
**conjunction** of shape and hue  
→ need to search

# Preattentive visual features (some)

# The brain compensates somehow

## Blind spot

- Look at graphic of the cross and the circle
- Cover your LEFT eye and stare at the cross with your RIGHT eye.
- SLOWLY move towards the computer screen while still staring at the cross with your RIGHT eye.
- At somewhere around 10-14 inches from the computer screen – the black circle will disappear

# Change blindness

# Change blindness

# Müller-Lyer Sinusoidal Waves

*New variant by Gianni A. Sarcone*

Though the **blue** and **red** segments seem to oscillate,  
they are always the **same length**! **Nothing moves except  
the arrows** at the endpoints of each color segment...

# Conclusion (temporary) on Vision

- We do not understand vision by ourselves
  - Even if we use it all the time
- Many super capabilities
  - Use them!
- Many super inabilities
  - Study them, avoid them!
- Intuition on visual feature to use will fail ALWAYS
  - Follow well-established guidelines

# Memory

Three types:

- Sensory memories
- Short-term memory
  - Working memory
- Long-term memory

## **Sensory memory**

- iconic | visual stimuli
- echoic | aural stimuli
- haptic | touch stimuli
- Constantly overwritten
- Info. passes from sensory to STM by attention

# Short-term Memory (STM)

- Scratch-pad
- Rapid access
  - 70ms
- rapid decay
  - 200ms
- limited capacity
  - 7 +/- 2 chunks
- Recency effect
- UI should avoid flushing the STM
- Many operations flush it
  - Writing (e.g. SQL)
  - Errors
  - Interruptions
- Keep users in the flow!

# Long-term Memory (LTM)

- Repository for all our knowledge
- slow access
  - 1-10 second
- slow decay, if any
- huge or unlimited capacity

Two types:

- Episodic
  - serial memory of events
- Semantic
  - structured memory of facts, concepts, skills
- Semantic LTM derived from episodic LTM

# Individual differences

- Long-term
  - Physical and intellectual abilities
- Short-term
  - Stress or fatigue
- Changing
  - Age, illness

Ask: will design decision  
exclude section of user  
population?

# Input devices

- Keyboard
  - Mouse
  - Pointer
  - Finger Touch
  - Voice
  - Signal processing  
(image, video, sound)
- Different devices support different styles of interaction
    - Performance and capabilities differ
    - Compatibility may be possible but at a cost

# Mouse / Pointer / Touch

- Handheld pointing device
- Mouse located on desktop
  - requires physical space
  - no arm fatigue
- Relative movement
- Screen cursor follows mouse
- Screen cursor oriented in (x, y) plane,
- mouse movement in (x, z) plane
- Multiple buttons (up to 5)
- Possible to track "proximity"
- Touch over the screen
  - No extra space
  - Arm fatigue
- Absolute movement
- Finger hides the point
- No buttons, just touch
- No proximity
  - But pressure arrives

# Movements

- Time to respond to stimulus:
  - reaction time
  - + movement time
- Movement time
  - dependent on age, fitness etc.
- Reaction time
  - dependent on stimulus

## Type:

- Visual: 200ms
- Auditory: 150 ms
- Pain: 700ms
- Increasing reaction time decreases accuracy in the *unskilled operators* not in the *skilled* ones.

# Movement: Fitts' Law

Movement time =  $a + b \log(\text{distance}/\text{size}+1)$

Where  $a$  and  $b$  are cst dependent of the user and setting.

Practical use:

- Buttons/targets should not be too small
- Important targets should be close to the mouse

# Interaction

Interaction: the communication between the user and the system

Donald Norman's Interaction framework

- User establishes the goal
- Formulates intention
- Specifies actions at interface
- Executes action
- Perceives system state
- Interprets system state
- Evaluates system state with respect to goal

# WIMP and Touch-Based

- Windows
- Icons
- Menus
- Pointers

Traditional now on  
desktop/laptop

Slightly different on tablets  
and telephones

# Usability paradigms and principles

- Designing for maximum usability is the goal of Design
- History of interactive system design provides paradigms for usable designs
- Principles of usability are more general means of understanding usability
- If not sure about principles, stick to established rules

# Direct Manipulation

1982 – Shneiderman describes graphically-based interaction

- Visibility of objects
- Incremental action and rapid feedback
- Reversibility encourages exploration
- Syntactic correctness of all actions
- Replace language with action

# Principles of good interfaces

## Usability

- Learnability
- Flexibility
- Robustness

## Learnability

- Predictability
- Synthesizability
- Familiarity
- Generalizability
- Consistency

# Introduction to Information Visualization

Jean-Daniel Fekete ([Jean-Daniel.Fekete@inria.fr](mailto:Jean-Daniel.Fekete@inria.fr)) +  
Petra Isenberg+Tamara Munzner+Chris North

# What is Information Visualization?

- The use of computer-supported, interactive, visual representations of abstract data to amplify cognition [Card et al. 99]
- Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively [Muzner 14]

# The Big Problem

Web, books, papers, game scores,  
Scientific data,  
Biotech,  
Shopping  
People  
Stock/finance  
News  
ML Models

## How?

Vision: 100 MB/s  
Ears: <100 b/s  
Telepathy  
Haptic/tactile  
Smell  
taste

Human

# Human Vision

- Highest bandwidth sense
- Fast, parallel
- Pattern recognition
- Pre-attentive
- Extends memory and cognitive capacity
  - (Multiplication test)
- People think visually

Impressive. Let's use it!

Presentation is everything!

# *Why visual data representations?*

- Vision is our most dominant sense
- We are very good at recognizing visual patterns
- We need to see and understand in order to explain, reason, and make decisions

common examples:

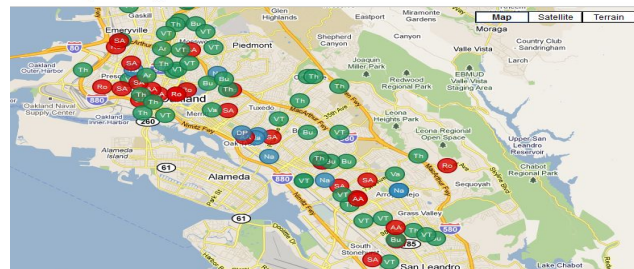

graphs / hierarchies

charts

**Crimespotting**

maps

## *Other benefits of visualization*

- expand human working memory
  - offload cognitive resources to the visual system,
- reduce search
  - by representing a large amount of data in a small space,
- enhance the recognition of patterns
  - by making them visually explicit
- aid monitoring of a large number of potential events
- provides a manipulable medium & allows exploration of a space of parameter values.

L'occhio,  
che si dice finestra dell'anima,  
è la principale via donde il comune senso può  
piú copiosamente e magnificamente considerare  
le infinite opere di natura.

Leonardo da Vinci  
(1452 - 1519)

The eye...  
the window of the soul,  
is the principal means  
by which the central sense  
can most completely and  
abundantly appreciate  
the infinite works of nature.

百聞不如一見

"One hundred rumors are not comparable to one look."

An Old Chinese Inscription

# *Information visualization*

- Create visual representation
- Concentrates on abstract data
- Includes interaction

Official Definition:

*The use of computer-supported, interactive, visual representations of abstract data to amplify cognition. [Card et al., 1999]*

# *Functions of Visualizations*

- Recording information
  - Tables, blueprints, satellite images
- Processing information
  - needs feedback and interaction
- Presenting information
  - share, collaborate, revise
  - for oneself, for one's peers and to teach
- Seeing the unseen

# History: Static Graphics

# *The Broadway Street Pump*

- In 1854 cholera broke out in London
  - 127 people near Broad Street died within 3 days
  - 616 people died within 30 days
- “Miasma in the atmosphere”
- Dr. John Snow was the first to link contaminated water to the outbreak of cholera
- How did he do it?
  - he talked to local residents
  - identified a water pump as a likely source
  - used maps to illustrate his theory
  - convinced authorities to disable the pump

It is difficult to create

***CREATE VISUALIZATIONS***

**GOOD**

# Why have a human in the loop?

**Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.**

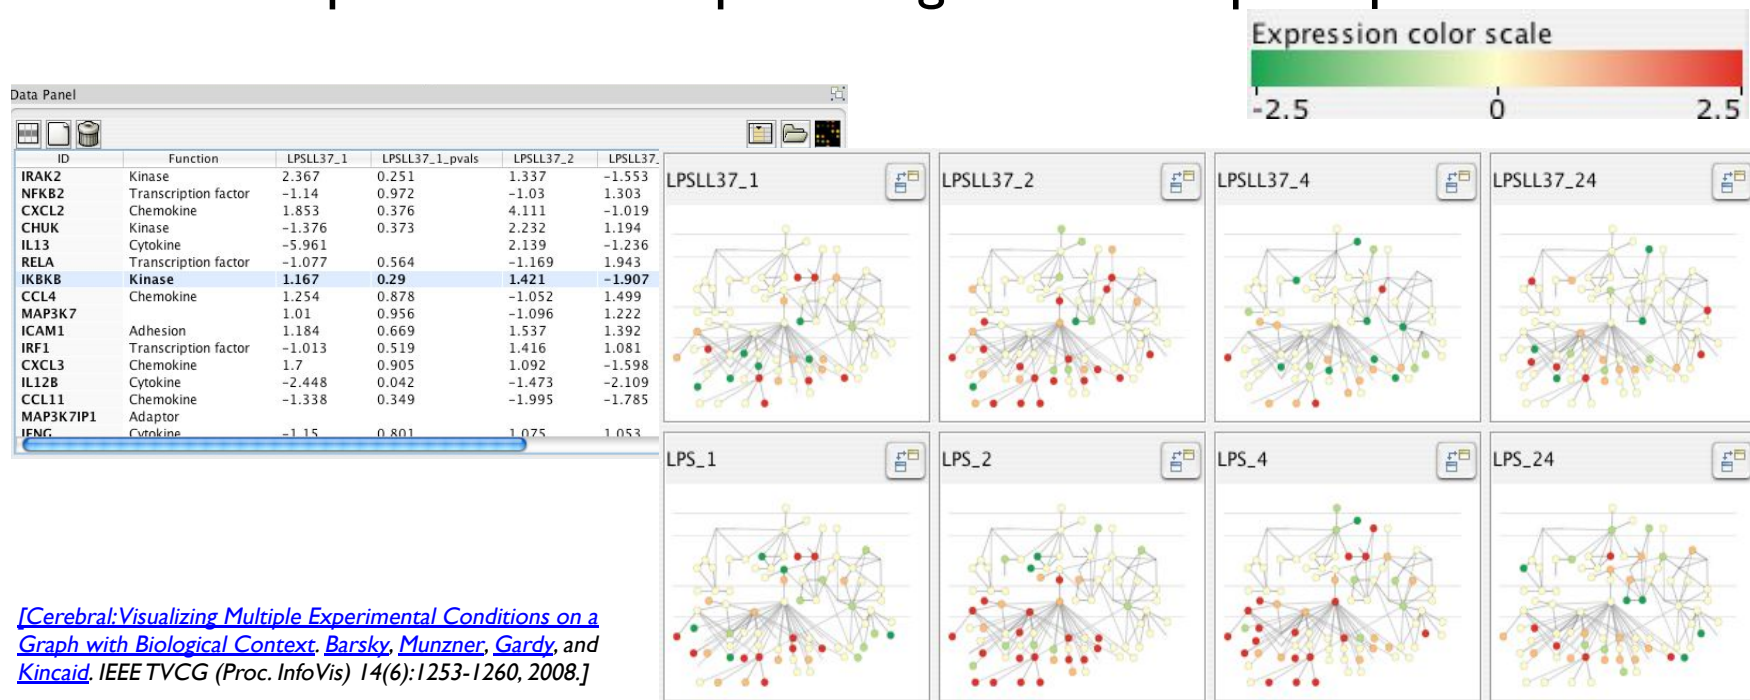

**Visualization is suitable when there is a need to augment human capabilities rather than replace people with computational decision-making methods.**

- don't need vis when fully automatic solution exists and is trusted
- many analysis problems ill-specified
  - don't know exactly what questions to ask in advance
- possibilities
  - long-term use for end users (ex: exploratory analysis of scientific data)
  - presentation of known results (ex: New York Times Upshot)
  - stepping stone to better understanding of requirements before developing models
  - help developers of automatic solution refine/debug, determine parameters
  - help end users of automatic solutions verify, build trust

# Why use an external representation?

**Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.**

- external representation: replace cognition with perception

[\[Cerebral: Visualizing Multiple Experimental Conditions on a Graph with Biological Context, Barsky, Munzner, Gardy, and Kincaid. IEEE TVCG \(Proc. InfoVis\) 14\(6\):1253-1260, 2008.\]](#)

# Why represent all the data?

**Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.**

- summaries lose information, details matter
  - confirm expected and find unexpected patterns
  - assess validity of statistical model

# Example

I		II		III		IV	
x	y	x	y	x	y	x	y

# *Data*

- Data is the foundation of any visualization
- The visualization designer needs to understand
  - the data properties
  - know what meta-data is available
  - know what people want from the data

## ➔ Data Types

# *Nominal, Categorical, Ordinal, and Quantitative*

- Nominal (labels)
  - Fruits: apples, oranges (open ended)
- Categorical
  - Male, Female (closed)
- Ordered
  - Quality of meat: grade A, AA, AAA
  - Can be counted and ordered, but not measured

- Quantitative: Interval
  - no clear zero (or arbitrary)
  - e.g. dates, longitude, latitude
  - usually compare differences (intervals)
- Quantitative: Ratio
  - meaningful origin (zero)
  - physical measurements (temperature, mass, length)
  - counts and amounts

# *Nominal, Ordinal and Quantitative*

- Nominal (labels)
  - Operations:  $=$ ,  $\neq$
- Ordered
  - Operations:  $=$ ,  $\neq$ ,  $<$ ,  $>$
- Quantitative: Interval
  - Operations:  $=$ ,  $\neq$ ,  $<$ ,  $>$ ,  $-$ ,  $+$
  - Can measure distances or spans
- Quantitative: Ratio
  - Operations:  $=$ ,  $\neq$ ,  $<$ ,  $>$ ,  $-$ ,  $+$ ,  $\times$ ,  $\div$
  - Can measure ratios or proportions

[1989 – 1999] + [2002 – 2012]

10kg / 5kg

# Why is this important?

- Nominal, ordinal, and quantitative data are best expressed in different ways visually
- They can be combined according to their Dataset Types
- But they can also be mapped visually through visual channels

## ➔ Dataset Types

# Mapping attributes

➔ Map  
from **categorical** and **ordered**  
attributes

➔ Color

➔ Hue

➔ Saturation

➔ Luminance

➔ Size, Angle, Curvature, ...

➔ Shape

➔ Motion

*Direction, Rate, Frequency, ...*

# *Why is this important?*

- Nominal, ordinal, and quantitative data are best expressed in different ways visually
- Data types often have inherent tasks
  - temporal data (comparison of events)
  - trees (understand parent-child relationships)
  - ...
- But:
  - any data type (1D, 2D,...) can be expressed in a multitude of ways!

# Visualization's Main Building Blocks

➔ Points

➔ Lines

➔ Areas

Marks which represent:

# Points

- “A point represents a location on the plane that has **no theoretical length or area**. This signification is independent of the size and character of the mark which renders it visible.”
- a location
- marks that indicate points can vary in all visual variables

# *Lines*

- “A line signifies a phenomenon on the plane which has **measurable length but no area**. This signification is independent of the width and characteristics of the mark which renders it visible.”
- a boundary, a route, a connection

# Areas

- “An area signifies something on the plane that **has measurable size**.  
This signification applies to the entire area covered by the visible mark.”
- an area can change in position but not in size, shape or orientation without making the area itself have a different meaning

# *Visual Variables Applicable to Marks*

# Practice...

# What channels are used?

# What channels are used?

# What channels are used?

# What channels are used?

# *Characteristics of Visual Variables*

- **Selective:**  
Can this variable allow us to spontaneously differentiate/isolate items from groups?
- **Associative:**  
Can this variable allow us to spontaneously group items in a group?
- **Ordered:**  
Can this variable allow us to spontaneously perceive an order?
- **Quantitative:**  
Can the difference between two marks in this variable be interpreted numerically?
- **Length (resolution):**  
Across how many changes in this variable are distinctions possible?

# Visual Variable: Position

- selective

- associative

- quantitative

- order

- length  
(resolution)

# Visual Variable: Size

- selective

- associative

- quantitative

- order

- length  
(resolution)

# *Size*

points

lines

areas

# Visual Variable: Shape

 • selective

 • associative

 • ordered

 • quantitative

 • length (resolution)  
— infinite

# Shape

points

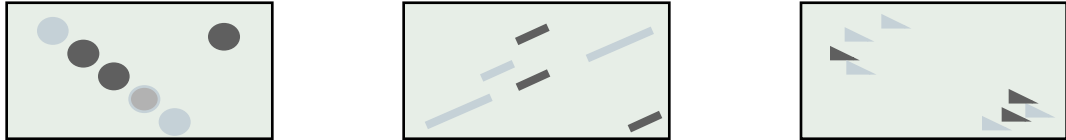

lines

areas

# Visual Variable: Value

- selective
  - 
- associative
  - 
- ≠ • quantitative
  - 
- order
  - 
- length (resolution)
  - theoretically infinite but practically limited
  - association and selection ~ < 7 and distinction ~ 10

# *Value*

points

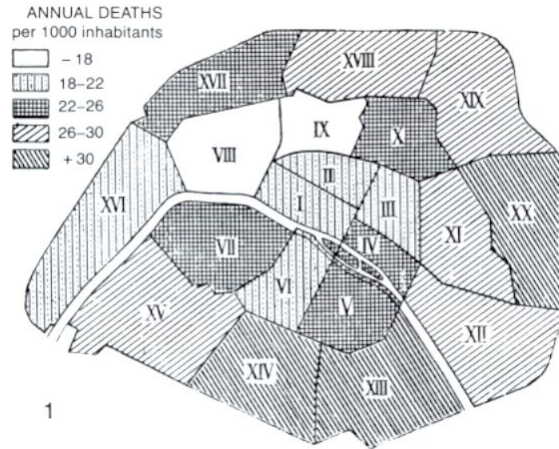

lines

areas

# Value

ordered, cannot be reordered

Values not ordered correctly according to scale  
Information has to be read point by point

Values ordered correctly  
Image much more useful

# Visual Variable: Color

- selective

- associative

- quantitative

- order

- length (resolution)

- theoretically infinite but practically limited
- association and selection ~ < 7 and distinction ~ 10

# Visual Variable: Orientation

• selective

• associative

• quantitative

• order

?

• length (resolution)

• ~5 in 2D; ? in 3D

# *Orientation*

points

lines

areas

# Visual Variable: Texture

- selective

- associative

- quantitative

- order

- length (resolution)
  - theoretically infinite

# *Texture*

points

lines

areas

# Visual Variables

Visual Variable	Selective	Associative	Quantitative	Order	Length
Position	Yes	Yes	Yes	Yes	Dependant on resolution
Size	Yes	Yes	Approximate	Yes	Association: 5; Distinction: 20
Shape	With Effort	With Effort	No	No	Infinite
Value	Yes	Yes	No	Yes	Association: 7; Distinction: 10
Hue	Yes	Yes	No	No	Association: 7; Distinction: 10
Orientation	Yes	Yes	No	No	4
Grain	Yes	Yes	No	No	5
Texture	Yes	Yes	No	No	Infinite
Motion	Yes	Yes	No	Yes	Unknown

# Summary

	Quantitative		Ordinal		Nominal
More Accurate	Position 		Position 		Position 
	Length 		Density 		Hue 
	Angle 		Saturation 		Density 
	Slope 		Hue 		Saturation 
	Area 		Length 		Shape 
	Density 		Angle 		Length 
	Saturation 		Slope 		Angle 
	Hue 		Area 		Slope 
Less Accurate	Shape 		Shape 		Area 

Jacques Bertin refined by Cleveland&McGill then by Card&Mackinlay

# Visual Structure

items = [ {x: 10, y: 20, intensity: 0.3}, ...];

# Views

# High-level systems

- On desktops
  - **Commercial:** Tableau, Spotfire, Qlik, Power BI
  - **For networks:** Cytoscape, Tulip, Gephi
- On the Web
  - **Commercial:** The same with their web versions
  - **Free:** Polestar, Voyager <https://vega.github.io/>

Always start to explore data with those to avoid wasting time.

# Low-level Systems

## Proliferation

- Many examples using Processing
  - <https://processing.org/>
- Web-based D3 very rich but **extremely difficult to harness**
  - D3.js

# Toolkits

Easy to use but need some coding

- Java (becoming a bit obsolete)
  - Cytoscape, Gephi
- Python
  - Many toolkits, e.g. Tulip (C++) can be used as a toolkit
  - Matplotlib, Seabord, ggpy, Bokeh, Altair
- JavaScript easy to deploy for web-based visualizations
  - D3 (be careful of the learning curve)
  - Vega-lite
- VTK and ParaView
  - Specialized for 3D but also work in 2D
  - <https://www.paraview.org/>

# Specialized environments

- R uses ggplot2 and extensions
- Python comes with (too) many toolkits
  - Matplotlib, Seaborn, Bokeh, Plotly, Altair
- Difficult to deploy as full applications for end-users
- Easy to use with notebooks for replicating analyses

# Grammar of Graphics

Book of Leland Wilkinson, 1999

Syntax to specify the construction of visualizations.

Implemented by:

- R with Ggplot2
- JavaScript with Vega lite

Use Vega lite if you can

Limited in scalability (50k items)

# Interaction with Visualization

Not an afterthought

Demos...

# Conclusion

- Visualization is now mature
- Use it for debugging, use it for showing many results to users
- Stick to well-established rules or collaborate with practitioners
- Not meant to embellish but to convey meaning effectively
- Use high-level toolkits rather than hand-crafted systems if you can
- Beware of fashionable unreadable visualizations
  - For graphs, avoid hairballs!
- Visualizations allow to increase recall and decrease precision
  - Humans can find what they want effectively
- Don't hesitate to ask around you for methods, don't reinvent the wheel!

# The Grammar of Graphics

<https://uwdata.github.io/visualization-curriculum/intro.html>

# Assignment

Reproduce figures from the IPCC report 2023 with legends and captions

- <https://www.ipcc.ch/report/ar6/syr/figures>
- [https://www.ipcc.ch/report/ar6/syr/downloads/report/IPCC\\_AR6\\_SYR\\_LongerReport.pdf](https://www.ipcc.ch/report/ar6/syr/downloads/report/IPCC_AR6_SYR_LongerReport.pdf)
- [https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC\\_AR6\\_WGI\\_Chapter\\_07\\_Supplementary\\_Material.pdf](https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC_AR6_WGI_Chapter_07_Supplementary_Material.pdf) (and others)
- <https://www.ipcc.ch/site/assets/uploads/2019/04/IPCC-visual-style-guide.pdf>
- <http://guidance.climatecognition.com/>

Using either:

- A Python notebook (using Altair or another system)
- An Observable notebook (using Vega-lite or Plot)

First, produce a figure as similar as possible from the original then improve it with hyperlinks and interactions, and document the rationales.
